## September/October 2002 Health News Index Survey

## Methodology

The Kaiser Family Foundation Health News Index Survey was designed and analyzed by researchers at the Kaiser Family Foundation and the Harvard School of Public Health. Fieldwork was conducted by telephone by Princeton Survey Research Associates International between October 10 and October 13, 2002, among a nationally representative random sample of 1,201 adults ages 18 and over.

The margin of sampling error for the survey is plus or minus 3 percentage points for total respondents. For results based on smaller subsets of respondents the margin of sampling error is higher. Note that sampling error is only one of many potential sources of error in this or any other public opinion poll.

Values less than $0.5 \%$ are indicated by an asterisk (*). "VOL" indicates that a response was volunteered by respondent, not an explicitly offered choice.
Q. 1 To begin... What do you think is the most important problem in health or health care for the government to address? Is there another health problem you think is almost as important?
