

Health Insurance Coverage of America's Children

January 2007

THE KAISER COMMISSION ON
Medicaid and the Uninsured

The Kaiser Commission on Medicaid and the Uninsured provides information and analysis on health care coverage and access for the low-income population, with a special focus on Medicaid's role and coverage of the uninsured. Begun in 1991 and based in the Kaiser Family Foundation's Washington, DC office, the Commission is the largest operating program of the Foundation. The Commission's work is conducted by Foundation staff under the guidance of a bipartisan group of national leaders and experts in health care and public policy.

Medicaid and the Uninsured

Health Insurance Coverage of America's Children 2005

Thirty-three million—over 40% of all children—are from poor or near-poor families.
Over twenty million rely on Medicaid and SCHIP for health insurance.
Nine million children were uninsured in 2005.

There are nearly 78 million children in the United States and their access to health care is determined in large part by whether or not they have health insurance coverage. Uninsured children are less likely to have a medical home compared to those with health insurance. Needed care is more likely to be postponed and uninsured children are also less likely to see a physician or dentist for standard preventive care. Unhealthy children miss school and their parents miss work to care for them – just some of the consequences experienced by nine million uninsured children today.

Health Insurance Coverage of Children and Adults, 2005

Data may not total 100% due to rounding.
SOURCE: KCMU/Urban Institute analysis of March 2006 CPS.

Children are at greater risk than adults of being uninsured because as a group they are more likely to be poor. While about a third of adults under age 65 come from low-income families (incomes less than twice the poverty level, which in 2005 was about \$40,000 for a family of four) -- over 40% of children come from low-income families. However, children are much less likely than adults to be uninsured (12% vs. 21% in 2005) because of two public insurance programs: Medicaid and the State Children's Health Insurance Program (SCHIP). Medicaid and SCHIP cover all children whose family incomes are below levels set by individual states that are at or above federal minimum requirements.

Medicaid, SCHIP, and other state programs for children's coverage play an important role in providing health insurance for children. The programs cover about 60% of all poor children (family

incomes less than the poverty level) and about 40% of near-poor children (those with family incomes between one and two times the poverty level). Including higher income children with disabilities who qualify, these public programs insure more than a quarter of all children in the United States.

This chartbook provides fundamental facts about children's health insurance coverage today. Using the most recent Census Bureau data available (2005), it examines children's coverage by:

- family income
- family work status
- type of family or household
- age
- health status
- race and ethnicity
- citizenship status, and
- geographic region.

In addition to figures, each section also contains tables that provide more detailed information about family income and health insurance. For example, estimates of the share of uninsured children in families with full-time workers who are from poor, near-poor, middle-income or higher income families are included in the tables. Not all subgroups of children could be analyzed in this way however, because the survey sample size was not large enough to produce a reliable estimate in all cases. Health insurance coverage of racial and ethnic minority children by income groups was possible only for Whites, Blacks, and Hispanics, for example. Sample sizes were too small for Asian, American Indian, and multiracial children to analyze their health coverage by income groups as well. In addition, a set of state-level tables (for all children, low-income children, and uninsured rates by poverty level) can be found at the end of the chartbook.

Family Poverty Level and Health Coverage

While 43% of all children come from poor or near-poor families, nearly three-quarters (73%) of uninsured children come from low-income families (less than 200% of the poverty level, e.g., about \$40,000 for a family of four in 2005). The majority of low-income children do not have private health insurance.

Children Uninsured vs. Population, by Poverty Level, 2005

Data may not total 100% due to rounding. The federal poverty level was \$19,971 for a family of four in 2005.
SOURCE: KCMU/Urban Institute analysis of March 2006 CPS.

Public insurance programs -- Medicaid, SCHIP, and other state programs -- are essential sources of coverage for children in this country, covering about 60% of all poor children and about 40% of near-poor children. Over half (58%) of nonelderly Medicaid beneficiaries are children. Yet, more than one in five poor children and 17% of near-poor children remain uninsured. Many of them have parents who may not know about these public programs or think their children are not eligible.

Children's Health Insurance Coverage by Poverty Level, 2005

Rows may not total 100% due to rounding. The federal poverty level was \$19,971 for a family of four in 2005.
SOURCE: KCMU/Urban Institute analysis of March 2006 CPS.

Work Status and Health Coverage

Although job-based health insurance is declining, it still covers more than half of children in this country. However, not all working families have access to, or can afford, employer-sponsored insurance. Nearly 70% of uninsured children live in families where there is at least one full-time worker.

Children Uninsured vs. Population, by Family Work Status, 2005

Children are considered to be in full-time worker families if at least one parent in the home works full-time.
SOURCE: KCMU/Urban Institute analysis of March 2006 CPS.

A fifth of children in families with a full-time worker are covered by Medicaid or other public insurance; leaving 10% of this large group of 64 million children with no health insurance. Fewer than half of low-income children living in families with at least one full-time worker have employer-sponsored insurance.

Children's Health Insurance Coverage by Family Work Status, 2005

Rows may not total 100% due to rounding. Children are considered to be in full-time worker families if at least one parent in the home works full-time.

Household Type and Health Coverage

Most children live in households with both their parents (68%), as do over half of uninsured children. Uninsured children however, are more likely than others to live with just one parent and/or with grandparents, or other extended family members (referred to as multigenerational and other households here).

Uninsured Children vs. All Children, by Household Type, 2005

Approximately 1% of children live in households with no adult, three-quarters of whom are 17-18 years old.
SOURCE: KCMU/Urban Institute analysis of March 2006 CPS.

Children living with both their parents are the most likely to have private health insurance (72%) because family incomes are generally higher and there are potentially two sources for employer-based insurance. Children living with one parent are more likely to qualify for Medicaid and SCHIP and, for them, these programs are the primary source of health insurance, covering nearly half of these children (47%). Children living with extended family are the least likely to have health coverage—25% are uninsured.

Children's Health Insurance Coverage by Household Type, 2005

Rows may not total 100% due to rounding. Approximately 1% of children live in households with no adult, three-quarters of whom are 17-18 years old.

* Multigenerational/other households with children include families with at least three generations in a household, plus families in which adults are caring for children other than their own (e.g. a niece living with her aunt).

** Totals do not equal 100% because approximately 4% of uninsured children live in households with no adult.

() = Estimate has a large 95% confidence interval of +/- 5.0 - 7.9 percentage points.

Estimates with larger margins of error are not provided.

Age and Health Coverage

Both the youngest and the oldest children—those less than one year and 18 year olds—are disproportionately likely to be uninsured. Eighteen year olds are at greatest risk of being uninsured. They make up five percent of all children, but eight percent of uninsured children, in part, because some of them are no longer living at home and are no longer dependents.

Children Uninsured vs. Population, by Age Group, 2005

SOURCE: KCMU/Urban Institute analysis of March 2006 CPS.

Children not in school yet, particularly those under a year old, are least likely to have private insurance because their mothers may be less likely to be in the workforce, which both reduces the family's income and decreases access to employer-sponsored coverage for the family. Because more pre-schoolers come from low-income families, they are also more likely to have public coverage than older children. Were it not for Medicaid and SCHIP, the chances of being uninsured among children would be much higher, particularly among pre-schoolers.

Health Status and Health Coverage

Uninsured children are somewhat less likely to be in the very best of health. While 81% of all children are reported to be in excellent or very good health, 75% of uninsured children are in such good health.

Children Uninsured vs. Population, by Health Status, 2005

SOURCE: KCMU/Urban Institute analysis of March 2006 CPS.

Among children in the worst health (reported as fair or poor), the majority are covered by Medicaid and other public insurance, with just 30% having private insurance. In contrast, two-thirds of children in the best of health are insured privately, and a quarter are covered by public programs.

Race and Health Coverage

Almost 60% of all children are White in this country, but they comprise only 38% of uninsured children. As a group, White children come from higher income families, which explains part of the racial and ethnic differences in health coverage. Hispanic children make up just 20% of all children, but 38% of uninsured children.

Children Uninsured vs. Population, by Race, 2005

Data may not total 100% due to rounding. American Indian category includes Aleutian Eskimos.
SOURCE: KCMU/Urban Institute analysis of March 2006 CPS.

The majority of White, Asian, and multiracial children have private health insurance, compared to about 40% of Black, Hispanic, and American Indian children. Medicaid plays a larger role for low-income groups; still, among American Indians and Hispanics, more than 20% of children are uninsured.

Citizenship and Health Coverage

Almost 90% of uninsured children are U.S. citizens. However, non-citizen children are disproportionately represented among the uninsured (12% vs. 4% of all children) in part because they are more likely to be from low-income families and many do not qualify for public coverage. The chances of being uninsured are three to four times greater among children who are not U.S. citizens compared to those who are citizens.

Children Uninsured vs. Population, by Citizenship Status, 2005

SOURCE: KCMU/Urban Institute analysis of March 2006 CPS.

Legal residents immigrating before 1996 are eligible for Medicaid in nearly all states, however, most legal immigrants entering the country after 1996 are only eligible for the full benefits of Medicaid after they have lived here five years unless their state chooses to provide separate coverage for legal non-citizens. Nearly half (45%) of non-citizen children who have lived in the U.S. less than five years have no health insurance.

Estimates with larger margins of error are not provided.

Region and Health Coverage

Health insurance coverage varies by region, and even by state, depending on the share of families with low incomes, the nature of employment in the area, and the inclusiveness of state Medicaid and SCHIP programs. While roughly a quarter of children live in ten southern states, over a third (35%) of uninsured children live there.

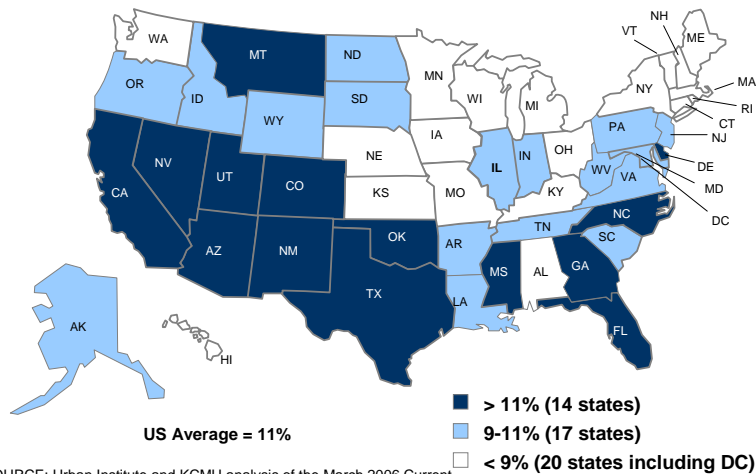

Children Uninsured vs. Population, by Region, 2005

Mountain/Pacific	29%		24%
Midwest	16%		23%
East/North East	20%		26%
South	35%		27%
	Uninsured		All Children
	9.0 Million		77.9 Million

SOURCE: KCMU/Urban Institute analysis of March 2006 CPS.

More than one in ten children nationally are uninsured, but the chances of being uninsured range three fold across the states--from a low of 6% (in several states: AL, HI, IA, MA, MI, NE, NH, VT) to 18-20% (NM and TX). All but one of the states in which children's uninsured rates exceed the national average are in the southern and western regions.

Uninsured Rates for Children under 19, by State, 2004-2005

Table Endnotes

The term family as used in family income, family poverty levels, and family work status, is defined as a health insurance unit (those who are eligible as a group for "family" coverage in a health plan) throughout this report.

- ^a Children includes all individuals under age 19.
- ^b Other includes other public insurance (mostly Medicare and military-related). S-CHIP is included in Medicaid.
- ^c The 2005 federal poverty level for a family of four was \$19,971.
