March/April 2003 Health News Index Survey

April 2003

Methodology

The Kaiser Family Foundation *Health News Index Survey* was designed and analyzed by researchers at the Kaiser Family Foundation and the Harvard School of Public Health. Fieldwork was conducted by telephone by Princeton Survey Research Associates International between April 3-6, 2003, among a nationally representative random sample of 1,211 adults ages 18 and over.

The margin of sampling error for the survey is plus or minus 3 percentage points for total respondents. For results based on smaller subsets of respondents the margin of sampling error is higher. Note that sampling error is only one of many potential sources of error in this or any other public opinion poll.

Values less than 0.5% are indicated by an asterisk (*). "VOL" indicates that a response was volunteered by respondent, not an explicitly offered choice.
