

CAREFUL WHAT YOU CUT

The first 60 minutes after a traumatic injury is when a life is saved, or lost. Medical schools and teaching hospitals train doctors, nurses, and first responders to make the right decisions within that critical window. These are the medical professionals we count on to operate trauma and burn centers in addition to discovering life-saving cures.

Reducing the deficit is essential. But at a time when our nation faces a critical shortage of doctors, cutting federal support for doctor training and turning back the clock on life-saving medical discoveries makes no sense.

**America can't afford cuts that damage the nation's health.
Preserve funding for doctor training and medical research.**
